Proposal to Tasco: an AI renewal engine for compulsory motor insurance (TNDS)

GrowERP Insurance · BeyondPilot “AI for Insurance × Tasco” · submitted by GrowERP (Hans Bakker) · October 2026 · working system: tasco.growerp.net

1. BUSINESS PROBLEM

TNDS is the same cover at the same regulated price from every insurer, so customers renew late, with whoever reminds them at the right moment, or not at all. Discounts are not allowed and no answer. Renewal is won on **timing, clarity and an easy next step**, and a person when the customer wants one. Today reminders go out broadly, on fixed schedules and channels. Telesales calls without knowing who is likely to renew. Every extra step between “your cover ends” and “renewed” loses customers.

2. PROPOSED AI SOLUTION: ONE RENEWAL JOURNEY ACROSS VETC, ZALO AND TELESALES

Briefing track	What runs today in the demo system (synthetic data)
B. Lead scoring and enrichment	Every customer due within 60 days gets an **explainable score** (renewal history, reactions to earlier reminders, consent, profile completeness, timing) with plain reasons, a band, profile completeness and missing fields, and the **next best channel and time of day**, taken from the consented channel the customer reacts to most.
C. Renewal engine	AI drafts each reminder in Vietnamese from the policy facts only: calm, no discounts, one next step, and how to stop. It is sent on the chosen channel (Zalo / VETC push / SMS / email; Zalo and VETC shown as phone previews until connected). One tap opens a **private renewal page** with no app and no login: the customer confirms the car with 3 plate characters, then **renews**, asks for a **call**, or says “sold / stop”.
A. AI voice bot	A Vietnamese AI call (speech by Gemini): it asks permission, confirms the vehicle, answers questions from the policy only and **hands over to telesales** with a summary, transcript and outcome code. Opt-out works at every step; the AI never quotes prices or decides.
D. Value beyond discount	The renewal page shows service instead of price: the digital certificate with a live QR check, guided claims with photo triage and status tracking, and roadside and service-centre help. Specific offers are marked “subject to compliance review”.
Telesales and measurement	A telesales queue (who asked for a call, AI hand-overs, renewal requests) with CRM-style outcome codes; “Renewed” renews the policy. A **funnel** by stage, channel and score band: reminded → opened → visited → confirmed → requested → renewed.

3. POC SCOPE (4 WEEKS, PROPORTIONATE)

In: one segment of TNDS policies due for renewal (for example one Tasco Auto dealer, or customers of one VETC region), scored and reminded through the renewal page; telesales hand-over; AI call for consenting customers; the funnel. Start on **masked data**, real data after compliance approval. **Out:** instant policy issuance (staff issue as today), new insurer APIs, pricing, and any customer contact without consent.

4. EXPECTED IMPACT AND SUCCESS CRITERIA

Metric (per channel and score band)	Baseline	PoC target	Assumption
Renewal rate of the segment before expiry	Tasco data, week 1	+5 to +10 points	Better timing and channel; one-tap page
Reminder → renewal page visit	Notification open rates	≥ 25% of reminded	Consented channel the customer reacts to
Telesales calls per renewal	CRM call outcomes	−30%	Calls go to high-score and hand-over cases
AI-call hand-overs useful to telesales	n/a	≥ 80% rated useful	Summary + transcript read before calling
Opt-out and complaint rate	Current rate	Not higher	Respectful frequency, stop in every message

Targets are hypotheses; definitions and baselines (renewal and conversion rates, open rates, call-outcome codes) are agreed in week 1.

5. FIT: WORKFLOWS, DATA, CONSENT AND INTEGRATION

- **Data fields needed:** policy number, insurer, start and end date, plate, vehicle; customer name, phone, email; consent per channel with date and source; past renewal and reminder events; call outcomes. A synthetic book is used today; masked data first.
- **Consent and privacy (Decree 13/2023):** contact only on channels with recorded consent; “stop” honoured everywhere; the renewal link is private (random token, plate check before details). Personal data stays on Tasco-approved hosting in Vietnam if required.
- **Integration (to validate, not assumed):** Zalo OA / VETC push sending and deep links, SMS gateway, a telephony line for the AI call, CRM call-outcome codes, and the issuance hand-off. Each has a manual fallback for the PoC (preview pages, staff dial-out,

CSV import/export), so nothing blocks week 2.

- **People decide:** staff issue renewals and own every call outcome; the AI drafts, scores, explains and hands over.

6. SPEED: TIMELINE AND DELIVERABLES

When	Work → deliverable
Week 1	Scope, NDA, consent texts, field mapping, baselines → signed scope and metric definitions
Week 2	Masked segment loaded, Tasco branding, Vietnamese copy review, channel set-up → live tenant
Week 3	Reminders and AI calls to consenting customers; telesales on the queue → mid-point review
Week 4	Measure against baseline → results report and scale / extend / stop recommendation

7. COST: OPEN SOURCE, PAY ONLY FOR WHAT RUNS

> **GrowERP is free and open source (Apache 2.0): no licence fees, no lock-in, Tasco keeps the code.** Tasco pays only for the production environment, enhancements and support.

- **Production environment (managed by us, or on Tasco's cloud):** priced by the number of users, quoted once the pilot scope is known; the PoC runs on our infrastructure at no charge.
- **Enhancements** (Zalo OA, VETC, telephony, CRM and issuance integrations): a fixed price per enhancement, set by its size once scoped in week 1.
- **Support and operations:** priced by the number of users, together with the environment.
- **AI usage passed through at cost** (Gemini today, switchable per tenant): drafting a reminder costs a fraction of a cent; an AI call is dominated by speech time. Every call is logged per tenant under a monthly budget.

8. FROM POC TO PRODUCTION

- **Scale:** from one segment to all TNDS renewals, then voluntary motor (where lead scoring and service value matter more), on the same multi-tenant platform.
- **Integrate:** live Zalo OA and VETC notifications, telephony for the AI call, the CRM, and policy issuance; claims and digital certificate (already built) as the next phase.
- **Govern:** audit trail of every contact, consent registry, explainable scores reviewed with telesales, monthly AI budget per tenant.
