

Proposal to Tasco: AI-assisted compulsory motor insurance that customers are glad to hold

GrowERP Insurance · BeyondPilot “AI for Insurance × Tasco” · submitted by GrowERP (Hans Bakker) · October 2026 · working prototype: tasco.growerp.net

1. BUSINESS PROBLEM

Compulsory motor insurance (TNDS) is regulated into sameness: identical cover and price from every insurer, bought only to comply. So nobody competes on experience, and it shows along the whole journey:

- **Buy:** cover written as legal text; renewals forgotten; nothing fitted to the individual driver.
- **Carry:** a paper certificate that gets lost; no instant, verifiable proof at a roadside check.
- **Claim:** calls and visits to report, photos and documents chased afterwards, slow assessment, no view of status. Every question goes to a hotline.

Tasco sees the whole journey (the car, VETC on the road, the service centre, the claim) and can turn this compliance product into a reason customers stay in its ecosystem, **without touching price**.

2. PROPOSED AI SOLUTION

One app for the driver (web/PWA, Android, iOS; Vietnamese and English) on the same system the agency or insurer runs its policies, claims and accounting on.

- **Digital policy card with live QR proof.** Police or a garage scan it with any phone and see valid or not, plate masked, no personal data.
- **Plain-language cover.** An LLM explains each policy from its own limits and deductibles, in the customer's language, inventing nothing.
- **Guided claim (first notice of loss) in minutes.** Incident type, time and place, and a photo checklist (plate, vehicle, damage, other party), with explicit consent.
- **AI photo triage for the adjuster.** A vision model reports damaged parts, severity, whether the car is drivable, whether the plate matches the policy, inconsistencies and missing evidence, plus a suggested next step (garage, roadside, inspection). **Advice only:** the AI never approves, denies or prices a claim.
- **Transparent status.** A timeline with a plain explanation of every step, and an email (later Zalo/SMS) on each change.
- **24/7 assistant.** Runs as the customer, so it sees only their own policies and claims plus the insurer's knowledge base. It hands off to a person when needed.
- **Calm renewal.** Reminders at 30, 7 and 1 day, and a one-tap renewal request to staff. No discounts, cashback or artificial urgency anywhere.

All of this already runs in the hosted prototype. The model is set per tenant (Gemini, Anthropic or OpenAI); the source is open (Apache 2.0).

3. POC SCOPE

In scope

- One segment: TNDS policyholders of one Tasco Auto dealer or branch (proposed 300–1,000 policies).
- Card and QR proof, plain-language cover, guided claim with AI triage, status timeline, assistant, and renewal reminders.
- Staff workspace for agents and adjusters, in Tasco branding and Vietnamese.

Out of scope for the PoC

- Automated claim decisions or payments; pricing and underwriting changes.
- Full core-system integration: CSV import and manual status updates stand in (section 7).
- Telematics or usage-based data.

4. EXPECTED BUSINESS VALUE

- **Lower claims handling cost:** complete first notice with photos, and a first read for the adjuster instead of phone calls.
- **Fewer service contacts:** status and questions answered in the app, and escalations routed with context.
- **Better retention:** timely, calm renewal and a product customers actually use, opening doors to Tasco's garage, roadside and vehicle-care services.
- **Compliance and trust:** verifiable proof on the road, consent and audit built in.

5. MEASURABLE SUCCESS CRITERIA

Metric	Baseline	PoC target	How measured
Time to report a claim	Tasco data, week 1	< 10 min median	Wizard start to submit, from app logs
Claims complete at first submission	Tasco data, week 1	> 70%	Adjuster requests no extra evidence

Metric	Baseline	PoC target	How measured
Time to first adjuster decision	Tasco data, week 1	Same day for minor damage	Status audit log
AI triage usefulness	n/a	≥ 80% rated “helpful”	Adjuster rating per claim
“Where is my claim?” contacts	Hotline logs	–50% in segment	Hotline tags vs. assistant escalations
Renewal requested before expiry	Tasco data, week 1	+10 points	Renewal requests vs. policies due
Customer satisfaction	n/a	CSAT ≥ 4.2 / 5	In-app survey after a claim or renewal

Targets are hypotheses to test; baselines and definitions are agreed in week 1.

6. TIMELINE AND KEY DELIVERABLES

When	Work	Deliverable
Week 1 · 3–7 Nov	Scope lock, NDA, consent texts, data access	Signed scope and metric definitions; legal review of consent (Decree 13/2023)
Week 2 · 10–14 Nov	Policy import, branding, knowledge base, Vietnamese copy review	Tasco tenant live in a sandbox with real pilot policies
Week 3 · 17–21 Nov	Claim status sync or staff workflow; Zalo/SMS if approved	Integration notes; mid-point checkpoint report
Week 4 · 24–28 Nov	Live use by agents, adjusters and pilot customers	Metrics dashboard and results report
By 5 Dec	Joint review	Written scale / extend / stop recommendation with production plan and quote

7. RESOURCES AND DATA REQUIRED FROM TASCO

Item	Purpose	Fallback in the PoC
TNDS policy extract for the segment (policy no., holder, plate, vehicle, dates, cover)	Cards, reminders and claims on real policies	CSV export, imported by us
Claim status from the insurer's system	Live customer timeline	Staff update status in the app
Policy wording, claim rules, FAQ	Assistant and explanations	Public TNDS rules
VETC plate/vehicle data (with consent)	Pre-fill, plate check in triage	Plate entered by customer
Garage and roadside contacts or API	Act on “suggested next step”	Staff call the garage
Zalo OA or SMS sender	Reminders and status messages	Email and in-app

People (estimated): a business owner (about 2 h/week), an IT contact for data export (about 1 day), 2–3 agents or adjusters in week 4, and legal/compliance review of consent and data texts in week 1.

8. ESTIMATED COSTS

The PoC is free of charge to Tasco. GrowERP covers development, configuration, hosting and AI model usage for the four weeks. Tasco contributes only the staff time and data listed in section 7.

- **Production (only after a “scale” decision):** subscription per active policy, [VND ____ / policy / month], including hosting, updates and support; or licence-free on-premise or in Tasco's cloud with a support contract of [VND ____ / year]. AI usage is passed through at cost (estimated [VND ____] per triaged claim and [VND ____] per 1,000 assistant questions).
- **Integrations:** core policy system, claim status, VETC, Zalo, garage network. Fixed quote after the PoC, based on the interfaces Tasco chooses: [VND ____].

9. PATH TO PRODUCTION

- **Roll out:** from one dealer to all Tasco Auto dealers, then voluntary motor, and then other lines on the same platform. The data model already covers any policy type.
- **Integrate and operate:** REST connections to the core policy and claims systems, VETC, the garage and roadside network, and Zalo, or embed our screens in Tasco's customer app. Multi-tenant, containerised and deployable in Vietnam; the AI queue absorbs peaks (Tết renewals, rainy-season claims) without slowing claim intake.
- **Govern:** human-in-the-loop decisions, audit logs of status changes and every AI call, monthly AI budgets per tenant, and periodic review of triage quality with adjusters.
